

Mixing And Matching Sensor Format With Lens Coverage

Henry Dietz

IQSP-215, 4:20PM February 16, 2016

University of Kentucky
Electrical & Computer Engineering

Film Formats

- Many film formats common, 16mm to 4x5", but 135 cartridge 24x36mm dominated
- In 1996, Advanced Photo System (APS 240) allowed programmable cropping:
 - H (High Definition) 30.2x16.7mm
 - C (Classic) 25.1x16.7mm
 - P (Panoramic) 30.2x9.5mm
- Digital camera sensors have been smaller...

Sensor Formats... Are Also Lens Formats

- “Full Frame” digital cameras are ~36x24mm
 - Lens must cover 43.3mm diameter
- Square crop of full frame is ~24x24mm
 - Lens must cover 33.9mm diameter (78%)
- Digital APS-C is ~23.7x15.6mm (1.52x crop)
 - Lens must cover 28.4mm diameter (66%)
... about 6% undersize from film APS C
- *Canon APS-C* is ~22.3x14.9mm (1.61x crop)
 - Lens must cover 26.8mm diameter (61%)

Format Mismatch

- FF : APS-C (or smaller) format availability
 - 1:2.9 body sales (CIPA, 2014)
 - 7.4:1 used lenses (KEH, Nov. 28, 2015)
 - Upgrade path from APS-C to FF...
- Focal Reducers (FR) reduce focal length, coverage, and f /number; increase resolution
- Teleconverters (TC) increase focal length, coverage, and f /number; decrease resolution
- Does coverage change balance resolution?

E.g., APS-C Fisheye On FF + TC

- Opteka 6.5mm APS-C “rectangular” fisheye... on FF using 1.5x (1.56x measured) FF TC

Lens Mount Compatibility

- Within a camera brand, often compatible
- **At least 90 different mounts** (Wikipedia)
- Can **convert** a lens mount... **usually not easy**
- Can add an **adapter**:
 - **Glassless adapter** (**still focus to infinity?**)
 - Mirrorless short-flange-distance helps
 - Many available for **under \$10**
 - Can cheaply **3D-print custom adapters**
 - **Glass adapters** (low-magnification TCs)
 - TCs and FRs

Adapters & Converters Used

Adapter or Converter	Format	Magnification		Notes
		Market	Actual	
Metabones Speed Booster ULTRA	APS-C	0.71	0.71	can correct data
Zhongyi Lens Turbo	APS-C	0.726	0.73	
Zhongyi Lens Turbo II	APS-C	0.726	0.74	rectangular masking
glassless adapters	FF	-	1.00	
Kenko alpha-AF 1.4x Teleplus MC4 DGX	FF	1.4	1.39	8-pin data corrected
Rokunar 1.4x M/AF Tele-converter	FF	1.4	1.45	5-pin data corrected, “no lens” on E-mount
Kenko Mx-AF 1.5x Teleplus SHQ	FF	1.5	1.39	8-pin pass-through
Kenko N-AFd 1.5x Teleplus SHQ	FF	1.5	1.56	Nikon F mount

- Note that APS-C is **1.52x – 1.61x** crop...
which would be undone by **0.66x – 0.62x**
- **±1 stop** *f*/number change is **+0.71x** or **-1.41x**

A Bit About TCs...

- TCs can handle lens electronics 3 ways:
 1. No electronics nor wiring
 2. Pass-through wiring
 3. Processor actively translates lens signals
- Sony does not make E/FE-mount TCs and **says their LA-EA1/2/3/4 A-mount adapters will not work with TCs**
- Only the Kenko 1.4x was fully functional (type 3) on Sony E/FE via LA-EA1/2/3/4 adapters

Lenses Used

Lens Make, Designation	Format	Focal Length		<i>f</i> /number		Notes
Opteka Fish-Eye CS	APS-C	6.5		3.5		removable shade Samyang 8mm?
Sigma DC HSM	APS-C	8	16	4.5	5.6	zoom
Sigma EX DC	APS-C	10	20	4	5.6	zoom
Spiratone YS	FF	18		3.5		
Sony AF DT (SAL-1870)	APS-C	18	70	3.5	5.6	zoom
Mir 20	FF	20		3.5		KMZ
Spiratone Plura-Coat	FF	24		2.8		
Vivitar Auto Wide-Angle	FF	28		2.5		Kiron
Super-Takumar	FF	28		3.5		
Super-Multi-Coated Takumar	FF	35		2		
Super-Takumar	FF	50		1.4		
Auto Mamiya/Sekor	FF	55		1.4		
Sony AF DT (SAL-55200)	APS-C	55	200	4	5.6	zoom
Zenit MC Helios 44M-7	FF	58		2		

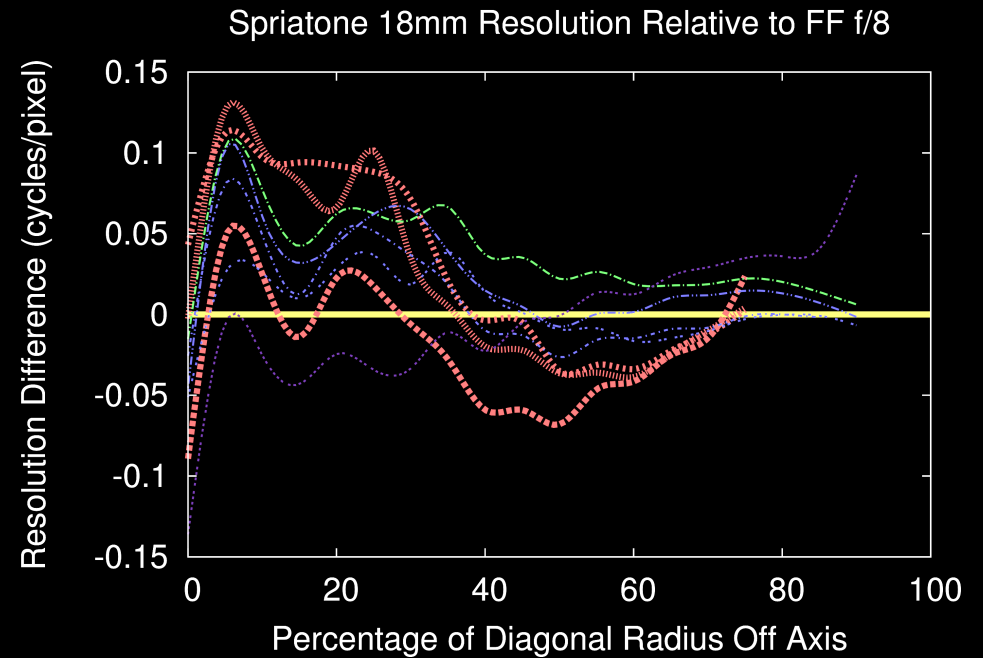

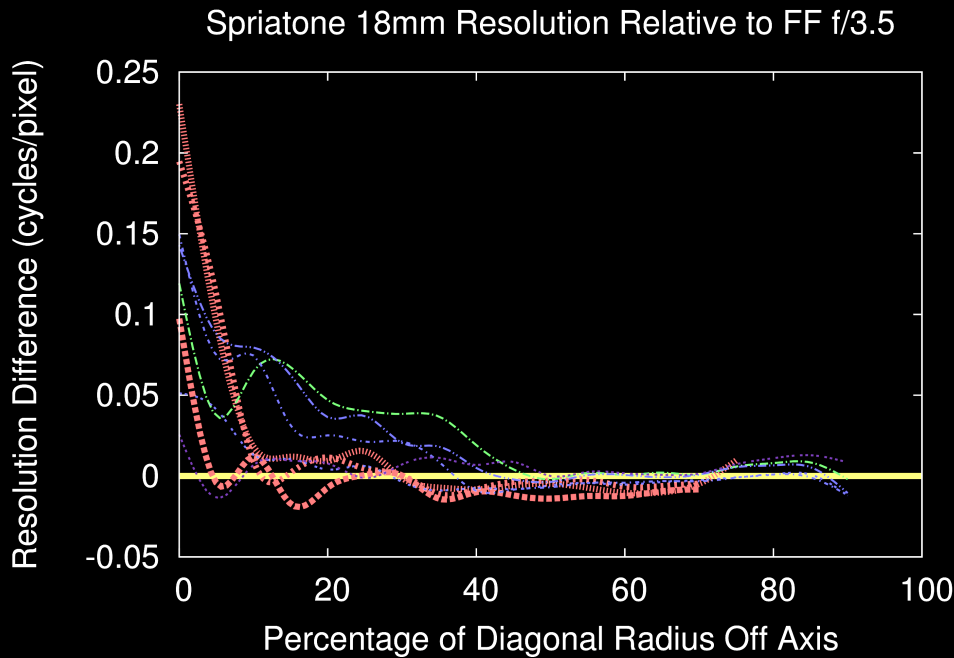

- Just the lenses discussed here...

MTF Measurement Procedure

- All measurements made using **Sony 24MP** – APS-C: **NEX-7**, FF: **A7** – at base ISO (100), “A” mode +1EV, *aligned* using manual focus, tripod & self-timer & electronic first curtain
- **Modulation Transfer Function at 50% contrast (MTF50) cycles/pixel** measurements:
 - Used free **MTF mapper** software
 - Slanted-edge target, inkjet “E” semi-gloss
 - **edge_mtf_values.txt** median-filtered in 5% diagonal radius off-axis bins

FF Lens: 18mm $f/3.5$ Spiratone

Mamiya/Sekor 55mm Resolution Relative to FF $f/8$

- Native FF wins, but not by a huge margin

FF Lens: 58mm $f/2$ Helios

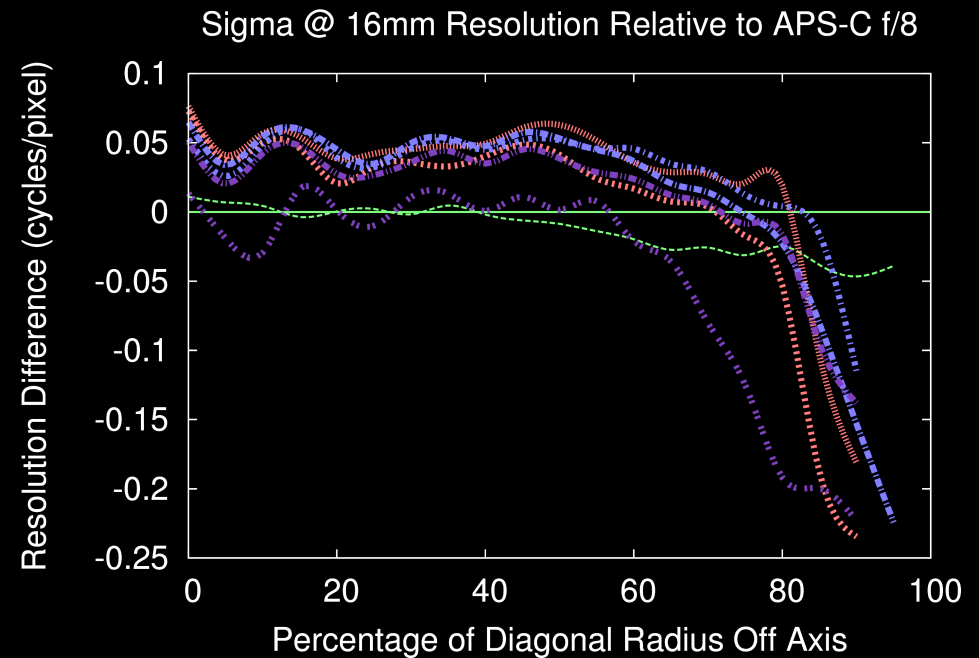

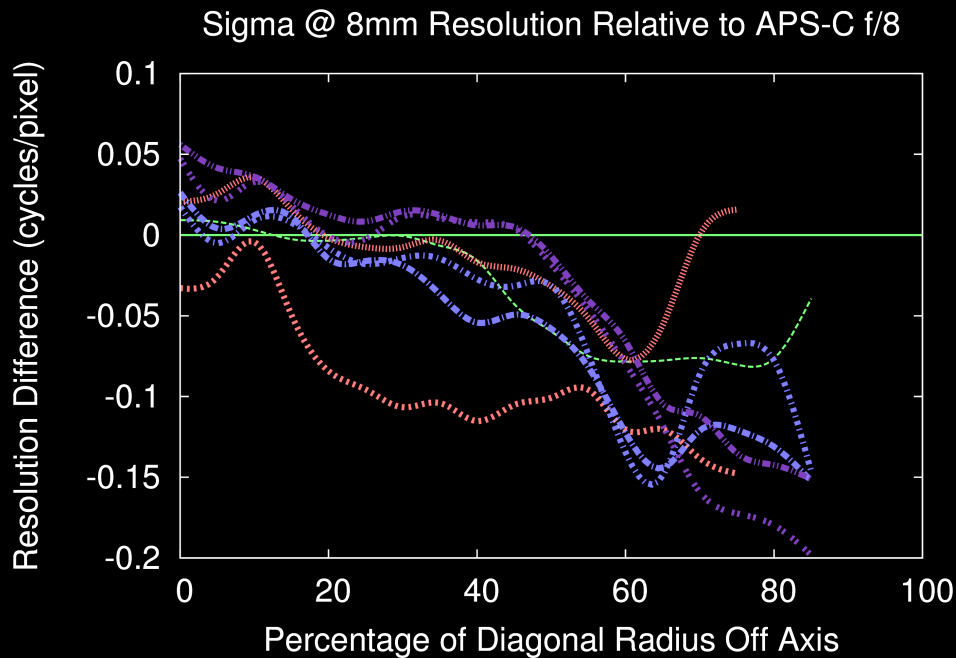

FF ——— Speed Booster Ultra FF Speed Booster Ultra APS-C
APS-C - - - Lens Turbo FF Lens Turbo APS-C
Kenko 1.4X APS-C Lens Turbo II FF Lens Turbo II APS-C

- No clear winner here... maybe FF or APS-C?

APS-C: 8-16mm $f/4.5-5.6$ Sigma

f/8 APS-C ——— f/8 FF - - - - - f/8 Kenko 1.4X FF - - - - - Rokunar 1.4X FF - - - - -
Wide Open APS-C - - - - - Wide Open FF - - - - - Wide Open Kenko 1.4X FF - - - - - Kenko 1.5X FF - - - - -

- Really too close to call except @ 8mm $f/8$

APS-C: 10-20mm $f/4-5.6$ Sigma

f/8 APS-C ——— f/8 FF f/8 Kenko 1.4X FF Rokunar 1.4X FF
Wide Open APS-C - - - - - Wide Open FF Wide Open Kenko 1.4X FF Kenko 1.5X FF

Sigma @ 10mm Resolution Relative to APS-C f/8

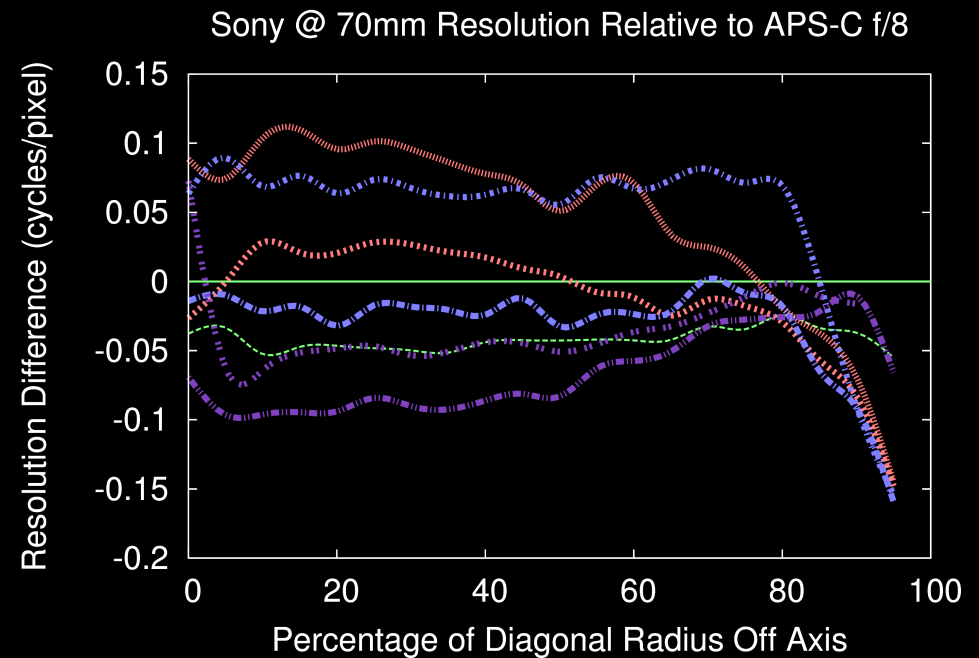

Sigma @ 20mm Resolution Relative to APS-C f/8

- Focus problem @ 10mm; only APS-C $f/8$ ok
- @ 20mm, FF TC did very well

APS-C: 18-70mm $f/3.5-5.6$ Sony

f/8 APS-C ——— f/8 FF ——— f/8 Kenko 1.4X FF ——— Rokunar 1.4X FF ———
Wide Open APS-C - - - - - Wide Open FF - - - - - Wide Open Kenko 1.4X FF ——— Kenko 1.5X FF ———

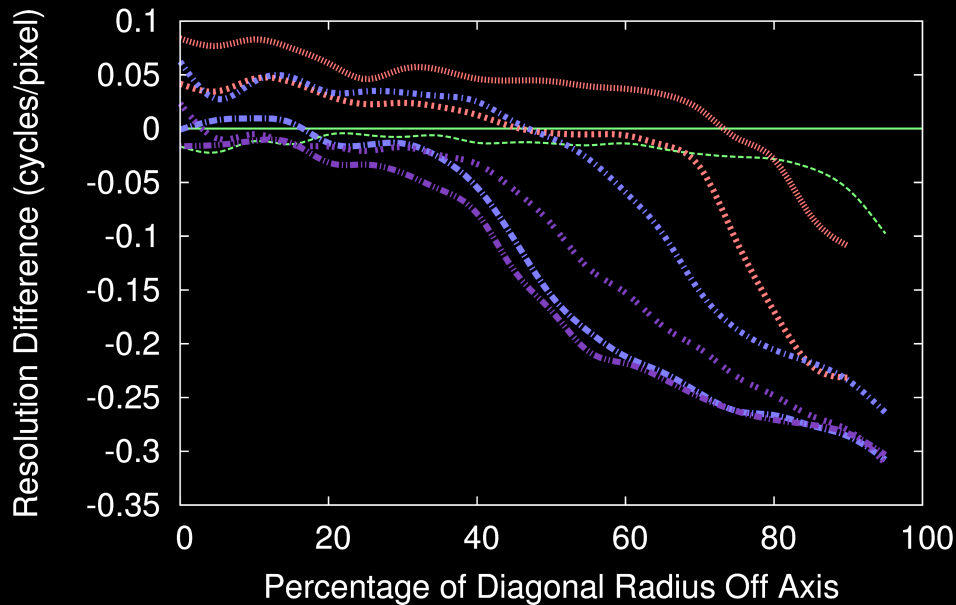

- FF and $f/8$ best until vignetting
- FF with TC and $f/8$ also better than native

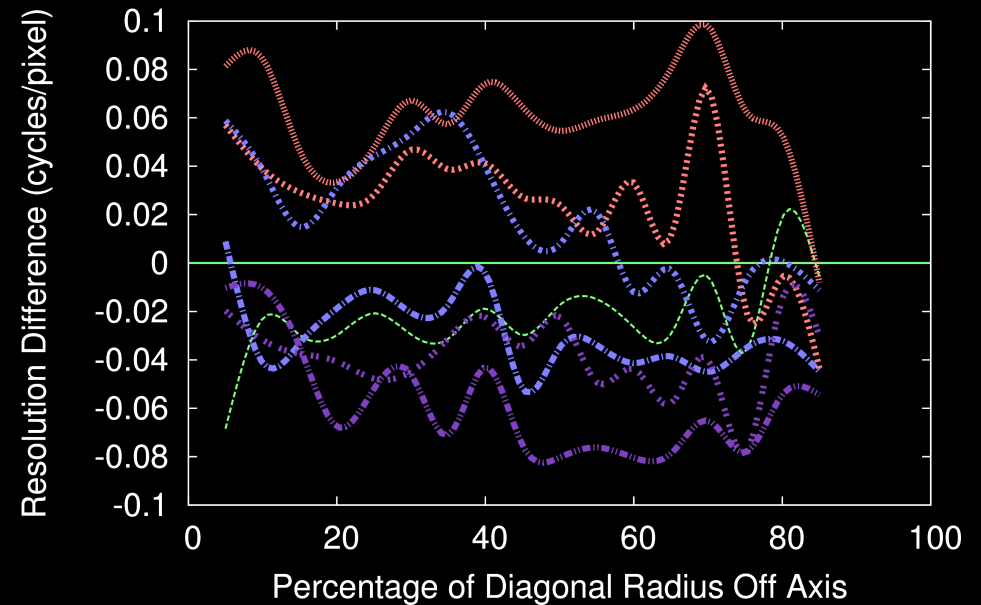

APS-C: 55-200mm $f/4-5.6$ Sony

f/8 APS-C ——— f/8 FF ——— f/8 Kenko 1.4X FF ——— Rokunar 1.4X FF ———
Wide Open APS-C - - - - - Wide Open FF - - - - - Wide Open Kenko 1.4X FF - - - - - Kenko 1.5X FF - - - - -

Sony @ 55mm Resolution Relative to APS-C f/8

Sony @ 200mm Resolution Relative to APS-C f/8

- FF best overall
- FF with TC and $f/8$ mostly better than native

What Did All Those MTF50 Measurements Tell Us?

- CA, SA, coma, field curvature, etc., will reduce MTF → resolution approximates image quality
- FF lenses:
 - Resolution generally was good for FF, but usually comparably good adapted
 - FRs often improve center resolution
- APS-C lenses:
 - Resolution on FF with TC often *beats* native
 - Direct use on FF helped mediocre centers

Vignetting Measurement Procedure

- All measurements made using **Sony A7**
- Same settings as for MTF50 measurement, and same target
- Lighting was adjusted to improve evenness
- Absolute amount of darkening matters less than gradient in perception of vignetting, so results were presented primarily as images; problem cases were obvious
- Native FF vignette is shown wide open

FF Lens Vignette: 18mm $f/3.5$ Spiratone

Spiratone 18mm Usable Area

Full-Frame, $f/3.5$

Speed Booster Ultra FF, $f/8$

Lens Turbo FF, $f/8$

Lens Turbo II FF, $f/8$

- Heavy vignetting on native FF
- FR avoids worst in APS-C or 23mm square

FF Lens Vignette: 20mm $f/3.5$ Mir 20

Mir 20 20mm Usable Area

Full-Frame, $f/3.5$

Speed Booster Ultra FF, $f/8$

Lens Turbo FF, $f/8$

Lens Turbo II FF, $f/8$

- Sharp vignetting $>2\text{EV}$ in FF extreme corners
- FR is fine in APS-C or 23mm square crop!

FF Lens Vignette: 35mm $f/2$ Takumar

Takumar 35mm Usable Area

Full-Frame, $f/2$

Speed Booster Ultra FF, $f/8$

Lens Turbo FF, $f/8$

Lens Turbo II FF, $f/8$

- Gentle vignetting gradient in FF

FF Lens Vignette: 58mm $f/2$ Helios

Helios 58mm Usable Area

Full-Frame, $f/2$

Speed Booster Ultra FF, $f/8$

Lens Turbo FF, $f/8$

Lens Turbo II FF, $f/8$

- Gentle vignetting gradient in FF

APS-C Lens Vignette: 8-16mm $f/4.5-5.6$ Sigma

Sigma @ 8mm Usable Area

Sigma @ 16mm Usable Area

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

- @ 8mm, 23mm square with trimmed hood?
- @ 8mm, good 24mm square with FR
- @ 16mm, covers FF even without FR

APS-C Lens Vignette: 10-20mm $f/4-5.6$ Sigma

Sigma @ 10mm Usable Area

Sigma @ 20mm Usable Area

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

- @ 10mm, 23mm square without TC
- @ 20mm, covers 24mm square without TC
- With FR, FF covered well at all focal lengths!

APS-C Lens Vignette: 18-70mm $f/3.5-5.6$ Sony

Sony @ 18mm Usable Area

Sony @ 70mm Usable Area

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

- @ 18mm, 23mm square without TC
- @ 18mm, extreme corners are dark with TC
- @ 70mm, even coverage with/without TC

APS-C Lens Vignette: 55-200mm $f/4-5.6$ Sony

Sony @ 55mm Usable Area

Sony @ 200mm Usable Area

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

Full-Frame, $f/8$

Kenko 1.4X, $f/8$

- @ 200mm, extreme corners dark without TC
- Covers FF with/without TC

APS-C 10-20mm $f/4-5.6$ Sigma On APS-C Vs. FF + TC

- Left: @ 10mm native APS-C
- Right: @ 10mm on FF using 1.4x TC

Conclusions

- IQ of adapted lenses often \geq native format
 - FRs often improve central resolution
 - TCs used to expand coverage also “”
 - Some APS-C lenses cover FF natively
- Biggest FF problem: vignetting (even native!)
- FF FR allows at least 23mm square crops
